

Statistical and Mathematical Methods for Data Analysis

Dr. Syed Faisal Bukhari

Associate Professor

Department of Data Science

Faculty of Computing and Information Technology

University of the Punjab

Textbooks

- ❑ **Probability & Statistics for Engineers & Scientists**, Ninth Edition, Ronald E. Walpole, Raymond H. Myer
- ❑ **Elementary Statistics: Picturing the World**, 6th Edition, Ron Larson and Betsy Farber
- ❑ **Elementary Statistics**, 13th Edition, Mario F. Triola

Reference books

- ❑ **Probability and Statistical Inference, Ninth Edition,** Robert V. Hogg, Elliot A. Tanis, Dale L. Zimmerman
- ❑ **Probability Demystified,** Allan G. Bluman
- ❑ **Practical Statistics for Data Scientists: 50 Essential Concepts,** Peter Bruce and Andrew Bruce
- ❑ **Schaum's Outline of Probability,** Second Edition, Seymour Lipschutz, Marc Lipson
- ❑ **Python for Probability, Statistics, and Machine Learning,** José Unpingco

References

Readings for these lecture notes:

- ❑ Probability & Statistics for Engineers & Scientists, Ninth edition, Ronald E. Walpole, Raymond H. Myer
- ❑ Elementary Statistics, Tenth Edition, Mario F. Triola

These notes contain material from the above resources.

Is σ is known ?

Yes

If either the population is normally distributed or $n \geq 30$, then use the standard normal distribution or Z-test

No

If either the population is normally distributed or $n \geq 30$, then use the t -distribution or t-test

When both $n < 30$ and the population is *not normally distributed*, we *cannot* use the standard normal distribution or the *t*-distribution.

| H_0 | Value of Test Statistic | H_1 | Critical Region |
|---|--|--------------------------|--|
| $\mu = \mu_0$ | $z = \frac{\bar{x} - \mu_0}{\sigma/\sqrt{n}}; \sigma \text{ known}$ | $\mu < \mu_0$ | $z < -z_\alpha$ |
| | | $\mu > \mu_0$ | $z > z_\alpha$ |
| | | $\mu \neq \mu_0$ | $z < -z_{\alpha/2} \text{ or } z > z_{\alpha/2}$ |
| $\mu = \mu_0$ | $t = \frac{\bar{x} - \mu_0}{s/\sqrt{n}}; v = n - 1,$ $\sigma \text{ unknown}$ | $\mu < \mu_0$ | $t < -t_\alpha$ |
| | | $\mu > \mu_0$ | $t > t_\alpha$ |
| | | $\mu \neq \mu_0$ | $t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$ |
| $\mu_1 - \mu_2 = d_0$ | $z = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{\sqrt{\sigma_1^2/n_1 + \sigma_2^2/n_2}};$ $\sigma_1 \text{ and } \sigma_2 \text{ known}$ | $\mu_1 - \mu_2 < d_0$ | $z < -z_\alpha$ |
| | | $\mu_1 - \mu_2 > d_0$ | $z > z_\alpha$ |
| | | $\mu_1 - \mu_2 \neq d_0$ | $z < -z_{\alpha/2} \text{ or } z > z_{\alpha/2}$ |
| $\mu_1 - \mu_2 = d_0$ | $t = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{s_p \sqrt{1/n_1 + 1/n_2}};$ $v = n_1 + n_2 - 2,$ $\sigma_1 = \sigma_2 \text{ but unknown,}$ $s_p^2 = \frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}$ | $\mu_1 - \mu_2 < d_0$ | $t < -t_\alpha$ |
| | | $\mu_1 - \mu_2 > d_0$ | $t > t_\alpha$ |
| | | $\mu_1 - \mu_2 \neq d_0$ | $t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$ |
| $\mu_1 - \mu_2 = d_0$ | $t' = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{\sqrt{s_1^2/n_1 + s_2^2/n_2}};$ $v = \frac{(s_1^2/n_1 + s_2^2/n_2)^2}{\frac{(s_1^2/n_1)^2}{n_1 - 1} + \frac{(s_2^2/n_2)^2}{n_2 - 1}},$ $\sigma_1 \neq \sigma_2 \text{ and unknown}$ | $\mu_1 - \mu_2 < d_0$ | $t' < -t_\alpha$ |
| | | $\mu_1 - \mu_2 > d_0$ | $t' > t_\alpha$ |
| | | $\mu_1 - \mu_2 \neq d_0$ | $t' < -t_{\alpha/2} \text{ or } t' > t_{\alpha/2}$ |
| $\mu_D = d_0$ paired observations | $t = \frac{\bar{d} - d_0}{s_d/\sqrt{n}};$ $v = n - 1$ | $\mu_D < d_0$ | $t < -t_\alpha$ |
| | | $\mu_D > d_0$ | $t > t_\alpha$ |
| | | $\mu_D \neq d_0$ | $t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$ |

Critical Region: Scenario 1

$H_1: \mu > \mu_0$ (One tailed test)

$Z_{cal} > Z_{tab}$, where $Z_{tab} = Z_{\alpha}$

Critical Region: Scenario 2

$H_1: \mu < \mu_0$ (One tailed test)

$Z_{\text{cal}} < Z_{\text{tab}}$, where $Z_{\text{tab}} = -Z_{\alpha}$

Critical Region: Scenario 3

$H_1: \mu \neq \mu_0$ (Two tailed test)

$Z_{\text{cal}} < Z_{\text{tab}}$, where $Z_{\text{tab}} = -Z_{\alpha/2}$ or $Z_{\text{cal}} > Z_{\text{tab}}$, where $Z_{\text{tab}} = Z_{\alpha/2}$
OR

$|Z_{\text{cal}}| > Z_{\text{tab}}$, where $Z_{\text{tab}} = Z_{\alpha/2}$

Approach to Hypothesis Testing with Fixed Probability of Type I Error

1. State the null and alternative hypotheses.
2. Choose a fixed significance level α .
3. Test statistic to be used it
4. Calculations
5. Critical region
6. Conclusion

Area under the Normal Curve [1]

Two Samples: Tests on Two Means

Example: An experiment was performed to compare the abrasive wear of two different laminated materials. **Twelve** pieces of material 1 were tested by exposing each piece to a machine measuring wear. **Ten** pieces of material 2 were similarly tested. In each case, the depth of wear was observed. The **samples** of material 1 gave an **average** (coded) wear of **85** units with a **sample standard deviation** of **4**, while the samples of material **2** gave an **average of 81** with a **sample standard deviation of 5**. Can we conclude at the **0.05** level of significance that the abrasive wear of material 1 exceeds that of material 2 by more than 2 units? Assume the populations to be approximately normal with **equal variances**.

Table A.4 Critical Values of the t -Distribution

| v | α | | | | | | |
|----------|----------|-------|-------|-------|-------|-------|--------|

| 120 | 2.076 | 2.196 | 2.358 | 2.468 | 2.617 | 2.860 | 3.373 |
| ∞ | 2.054 | 2.170 | 2.328 | 2.432 | 2.576 | 2.807 | 3.290 |

Solution:

$n_1 = 12$ (Sample size of material 1)

$\bar{x}_1 = 85$ (Sample mean of material 1)

$s_1 = 4$ (sample standard deviation of material 1)

$n_2 = 10$ (Sample size of material 2)

$\bar{x}_2 = 81$ (Sample mean of material 2)

$s_2 = 5$ (sample standard deviation of material 1)

$\alpha = 0.05$ (Level of significance)

Given assumption the populations to be approximately normal with **equal variances**

$\Rightarrow \sigma_1^2 = \sigma_2^2$ but unknown

1. **We state our hypothesis as:**

$$H_0: \mu_1 - \mu_2 = 2$$

$$H_1: \mu_1 - \mu_2 > 2$$

(One tailed test)

2. **The level of significance is set** $\alpha = 0.05$.

3. **Test statistic to be used is**

$$t_{\text{cal}} = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{s_p \sqrt{1/n_1 + 1/n_2}}$$

$$\text{where, } s_p = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}$$

$$s_1^2 = \frac{\sum (x_1 - \bar{x}_1)^2}{n_1 - 1}$$

and

$$s_2^2 = \frac{\sum (x_2 - \bar{x}_2)^2}{n_2 - 1}$$

4. **Calculations:** $s_p = \sqrt{\frac{(12 - 1)4^2 + (10 - 1)5^2}{12 + 10 - 2}} = 4.478$

$t_{cal} = \frac{(85 - 81) - 2}{4.478 \sqrt{1/12 + 1/10}} = 1.04$

5. **Critical region:**

$t_{cal} > t_{tab}$

Where $t_{tab} = t_{(\alpha, n1 + n2 - 2)} = t_{(0.05, 20)} = 1.725$

$1.04 > 1.725$ (False)

6. **Conclusion:** Since calculated value of t_{cal} is less than the tabulate value of t , so we accept H_0

Two Samples: Tests on Two Means

Example: An experiment was performed to compare the abrasive wear of two different laminated materials. **Twelve** pieces of material 1 were tested by exposing each piece to a machine measuring wear. **Ten** pieces of material 2 were similarly tested. In each case, the depth of wear was observed. The **samples** of material 1 gave an **average** (coded) wear of **85** units with a **sample standard deviation** of **4**, while the samples of material **2** gave an **average of 81** with a **sample standard deviation of 5**.

Cont.

Can we conclude at the **0.05** level of significance that the abrasive wear of material 1 exceeds that of material 2 by more than 2 units? Assume the populations to be approximately normal with **unequal variances**.

Solution:

$n_1 = 12$ (Sample size of material 1)

$\bar{x}_1 = 85$ (Sample mean of material 1)

$s_1 = 4$ (sample standard deviation of material 1)

$n_2 = 10$ (Sample size of material 2)

$\bar{x}_2 = 81$ (Sample mean of material 2)

$s_2 = 5$ (sample standard deviation of material 1)

$\alpha = 0.05$ (Level of significance)

Given assumption the populations to be approximately normal with **unequal variances**

$\Rightarrow \sigma_1^2 \neq \sigma_2^2$ but unknown

1. **We state our hypothesis as:**

$$H_0: \mu_1 - \mu_2 = 2$$

$$H_1: \mu_1 - \mu_2 > 2$$

(One tailed test)

2. **The level of significance is set** $\alpha = 0.05$.

3. **Test statistic to be used is**

$$t_{\text{cal}} = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

$$\text{where } s_1^2 = \frac{\sum (x_1 - \bar{x}_1)^2}{n_1 - 1} \text{ and } s_2^2 = \frac{\sum (x_2 - \bar{x}_2)^2}{n_2 - 1}$$

$$4. \text{ **Calculations: } t_{\text{cal}} = \frac{(85 - 81) - 2}{\sqrt{4^2/12 + 5^2/10}} = 2/1.8708 = \mathbf{1.0691}**$$

5. Critical region:

$$t_{\text{cal}} > t_{\text{tab}}$$

where $t_{\text{tab}} = t_{(\alpha, v)}$

$$v = \frac{(s_1^2/n_1 + s_2^2/n_2)^2}{[(s_1^2/n_1)^2/(n_1-1) + (s_2^2/n_2)^2/(n_2-1)]}$$

$$v = \frac{(4^2/12 + 5^2/10)^2}{[(4^2/12)^2/11 + (5^2/10)^2/9]}$$

$$v = 16.6944 / (0.1616 + 0.6944) = 19.5028 \approx 20$$

$$t_{(\alpha, v)} = t_{(0.05, 20)} = 1.725$$

$$t_{\text{cal}} = 1.0691$$

$$t_{\text{cal}} > t_{\text{tab}}$$

$$1.0691 > 1.725 \text{ (False)}$$

$$t_{\text{cal}} = 1.0691$$

$$t_{\text{cal}} < t_{\text{tab}}$$

$$1.0691 < 1.725$$

6. **Conclusion:** Since calculated value of t_{cal} is less than the tabulate value of t , so we accept H_0

1. When $\alpha = 0.05$ or $\alpha = 5\%$

$$Z_{\alpha/2} = Z_{0.0250} = 1.96 \quad \because 1 - \alpha/2 = 1 - 0.250 = 0.9750$$

2. When $\alpha = 0.01$ or $\alpha = 1\%$

$$Z_{\alpha/2} = Z_{0.005} = 2.575 \quad \because 1 - \alpha/2 = 1 - 0.005 = 0.9950$$

3. When $\alpha = 0.10$ or $\alpha = 10\%$

$$Z_{\alpha/2} = Z_{0.05} = 1.645 \quad \because 1 - \alpha/2 = 1 - 0.05 = 0.9500$$

Testing a Proportion

1. $H_0: p = p_0$.

One of the alternatives $H_1: p < p_0, p > p_0$, or $p \neq p_0$.

2. Choose a level of significance equal to α .

3. Test statistic: Binomial variable X with $p = p_0$.

$$Z_{\text{cal}} = \frac{x - np_0}{\sqrt{np_0q_0}} \quad \text{or} \quad Z_{\text{cal}} = \frac{\hat{p} - p_0}{\sqrt{p_0q_0/n}}$$

Where p_0 is the **population proportion** and \hat{p} is the **sample proportion**

4. Computations: Find x , the number of successes, and compute the appropriate P -value.

5. Decision: Draw appropriate conclusions based on the P -value.

Example: A **builder claims** that heat pumps are installed in **70%** of all homes being constructed today in the city of Richmond, Virginia. Would you **agree with this claim** if a **random survey** of new homes in this city showed that **8 out of 15** had heat pumps installed? Use a **0.10 level of significance**.

Solution:

$$p \text{ or } p_0 = 0.70$$

$$\hat{p} = x/n = 8/15 = 0.53$$

$$\hat{q} = 1 - 0.53 = 0.47$$

$$n=15$$

(population proportion)

(sample proportion)

1. We state our hypothesis as

$$H_0: p = 0.7.$$

$$H_1: p \neq 0.7 \text{ (two tailed test)}$$

2. The level of significance is set at $\alpha = 0.10$.

3. Test statistic to be used is:

$$Z_{\text{cal}} = \frac{\hat{p} - p_0}{\sqrt{p_0 q_0 / n}}$$

4. Calculations:

$$\begin{aligned} Z_{\text{cal}} &= \frac{0.53 - 0.70}{\sqrt{0.70(0.30)/15}} \\ &= -0.17/0.1183 = -1.4371 \end{aligned}$$

5. Critical region:

$$|Z_{\text{cal}}| > Z_{\text{tab}}$$

Where $Z_{\text{tab}} = Z_{\alpha/2} = Z_{0.05} = 1.645$

$1.4371 > 1.645$ (False)

6. **Conclusion:** Since calculated value of Z is less than the tabulated value of Z , so we accept H_0 and conclude that there is insufficient reason to doubt the builder's claim.

Example: A commonly prescribed drug for relieving nervous tension is believed to be only **60% effective**. Experimental results with a new drug administered to a random sample of **100 adults** who were suffering from nervous tension show that **70 received relief**. Is this sufficient evidence to conclude that the new drug is **superior** to the one **commonly prescribed**? Use a 0.05 level of significance.

Solution:

$$p \text{ or } p_0 = 0.60$$

(population proportion)

$$\hat{p} = x/n = 70/100 = 0.70$$

(sample proportion)

$$\hat{q} = 1 - 0.70 = 0.30$$

$$n = 100$$

(sample size)

1. We state our hypothesis as

$$H_0: p = 0.60$$

$$H_1: p > 0.60 \text{ (one tailed test)}$$

2. The level of significance is set at $\alpha = 0.05$.

3. Test statistic to be used is:

$$Z_{\text{cal}} = \frac{\hat{p} - p_0}{\sqrt{p_0 q_0 / n}}$$

4. Calculations:

$$Z_{\text{cal}} = \frac{0.70 - 0.60}{\sqrt{(0.60)(0.40)/10}} = 2.04$$

5. Critical region:

$$Z_{\text{cal}} > Z_{\text{tab}}$$

Where $Z_{\text{tab}} = Z_{\alpha} = Z_{0.05} = 1.645$

2.04 > 1.645 (True)

6. **Conclusion:** Since calculated value of Z is greater than the tabulated value of Z, so we reject H_0 .

Two Samples: Tests on Two Proportions

$$Z_{\text{cal}} = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)}{\sqrt{p_c q_c \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

where $p_c = \frac{x_1 + x_2}{n_1 + n_2}$ and $q_c = 1 - p_c$

Where **p_1** and **p_2** are the **population proportion from population 1 and population 2** and **\hat{p}_1** and **\hat{p}_2** are the corresponding respective **sample proportions**.

Example: A vote is to be taken among the residents of a town and the surrounding county to determine whether a proposed chemical plant should be constructed. The construction site is within the town limits, and for this reason many voters in the county believe that the proposal will pass because of the large proportion of town voters who favor the construction. To determine if there is a significant difference in the proportions of town voters and county voters favoring the proposal, a poll is taken. If **120 of 200** town voters favor the proposal and **240 of 500** county residents favor it, would you agree **that the proportion of town voters favoring the proposal is higher than the proportion of county voters?** Use an $\alpha = 0.05$ level of significance.

Solution:

$\hat{p}_1 = x_1/n_2 = 120/200 = 0.60$ (sample proportion of town voters, favoring it)

$$\hat{q}_1 = 1 - 0.60 = 0.40$$

$n_1 = 100$ (sample size of town voters)

$\hat{p}_2 = x_2/n_2 = 240/500 = 0.60$ (sample proportion of county residents, favoring it)

$$\hat{q}_2 = 1 - 0.60 = 0.40$$

$n_2 = 100$ (sample size of county residents)

$$p_c = \frac{x_1+x_2}{n_1+n_2} = (120 + 240)/(200 + 500) = 0.51$$

and $q_c = 1 - p_c = 0.49$

1. We state our hypothesis as

$$H_0: p_1 = p_2$$

$$H_1: p_1 > p_2 \quad (\text{one tailed test})$$

2. The level of significance is set at $\alpha = 0.05$.

3. Test statistic to be used is:

$$Z_{\text{cal}} = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)}{\sqrt{p_c q_c \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

$$\text{where } p_c = \frac{x_1 + x_2}{n_1 + n_2}, \text{ and } q_c = 1 - p_c$$

4. **Calculations:**

$$Z_{\text{cal}} = \frac{(0.60 - 0.48) - 0}{\sqrt{(0.51)(0.49)\left(\frac{1}{200} + \frac{1}{500}\right)}} = 2.9$$

5. Critical region:

$Z_{\text{cal}} > Z_{\text{tab}}$, where $Z_{\text{tab}} = Z_{\alpha} = Z_{0.05} = 1.645$

$2.9 > 1.645$ (True)

6. **Conclusion:** Since calculated value of Z is greater than the tabulated value of Z , so we are unable to accept H_0 agree that the proportion of town voters favoring the proposal is higher than the proportion of county voters.
