

Information Retrieval & Text Mining

Probabilistic Retrieval Model: Statistical Language Model

Dr. Iqra Safder
Information Technology University

Probabilistic Retrieval Model: Basic Idea

Overview

- What is a Language Model?
- Unigram Language Model
- Uses of a Language Model

What is a Statistical Language Model (LM)?

- A probability distribution over word sequences
 - $p(\text{"*Today is Wednesday*"}) \approx 0.001$
 - $p(\text{"*Today Wednesday is*"}) \approx 0.0000000000000001$
 - $p(\text{"*The eigenvalue is positive*"}) \approx 0.00001$
- Context-dependent!

This may be a reasonable language model for describing general conversations, but it may be inaccurate for describing conversations happening at a mathematics conference, where the sequence *The eigenvalue is positive* may occur more frequently than *Today is Wednesday*.

What is a Statistical Language Model (LM)?

- A probability distribution over word sequences
 - $p(\text{"*Today is Wednesday*"}) \approx 0.001$
 - $p(\text{"*Today Wednesday is*"}) \approx 0.0000000000000001$
 - $p(\text{"*The eigenvalue is positive*"}) \approx 0.00001$
- Context-dependent! Given a language model, we can sample word sequences according to the distribution to obtain a text sample. In this sense, we may use such a model to "generate" text. Thus, a language model is also often called a generative model for text.

Three arrows point from the dice to the following text samples:

Today is Wednesday
Today Wednesday is

The eigenvalue is positive

Why is a LM Useful?

- Quantify the uncertainties in natural language

Why is a LM Useful?

- Quantify the uncertainties in natural language
- Allows us to answer questions like:
 - Given that we see “*John*” and “*feels*”, how likely will we see “*happy*” as opposed to “*habit*” as the next word? (speech recognition)

Why is a LM Useful?

- Quantify the uncertainties in natural language
- Allows us to answer questions like:
 - Given that we see “*John*” and “*feels*”, how likely will we see “*happy*” as opposed to “*habit*” as the next word? (speech recognition)
 - Given that we observe “baseball” three times and “game” once in a news article, how likely is it about “sports”? (text categorization, information retrieval)

Why is a LM Useful?

- Quantify the uncertainties in natural language
- Allows us to answer questions like:
 - Given that we see “*John*” and “*feels*”, how likely will we see “*happy*” as opposed to “*habit*” as the next word? (speech recognition)
 - Given that we observe “baseball” three times and “game” once in a news article, how likely is it about “sports”? (text categorization, information retrieval)
 - Given that a user is interested in sports news, how likely would the user use “baseball” in a query? (information retrieval)

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$
- Parameters: $\{p(w_i)\}$ $p(w_1) + \dots + p(w_N) = 1$ (N is voc. size)

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$
- Parameters: $\{p(w_i)\}$ $p(w_1) + \dots + p(w_N) = 1$ (N is voc. size)

Given probabilities of each word, the sum of all is = 1

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$
- Parameters: $\{p(w_i)\}$ $p(w_1) + \dots + p(w_N) = 1$ (N is voc. size)
- Text = sample drawn according to this **word distribution**

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$
- Parameters: $\{p(w_i)\}$ $p(w_1) + \dots + p(w_N) = 1$ (N is voc. size)
- Text = sample drawn according to this **word distribution**

The Simplest Language Model: Unigram LM

- Generate text by generating each word INDEPENDENTLY
- Thus, $p(w_1 w_2 \dots w_n) = p(w_1)p(w_2)\dots p(w_n)$
- Parameters: $\{p(w_i)\}$ $p(w_1) + \dots + p(w_N) = 1$ (N is voc. size)
- Text = sample drawn according to this **word distribution**

$$\begin{aligned} p(\text{"today is Wed"}) \\ &= p(\text{"today"})p(\text{"is"})p(\text{"Wed"}) \\ &= 0.0002 \times 0.001 \times 0.000015 \end{aligned}$$

Text Generation with Unigram LM

computer 0.00001

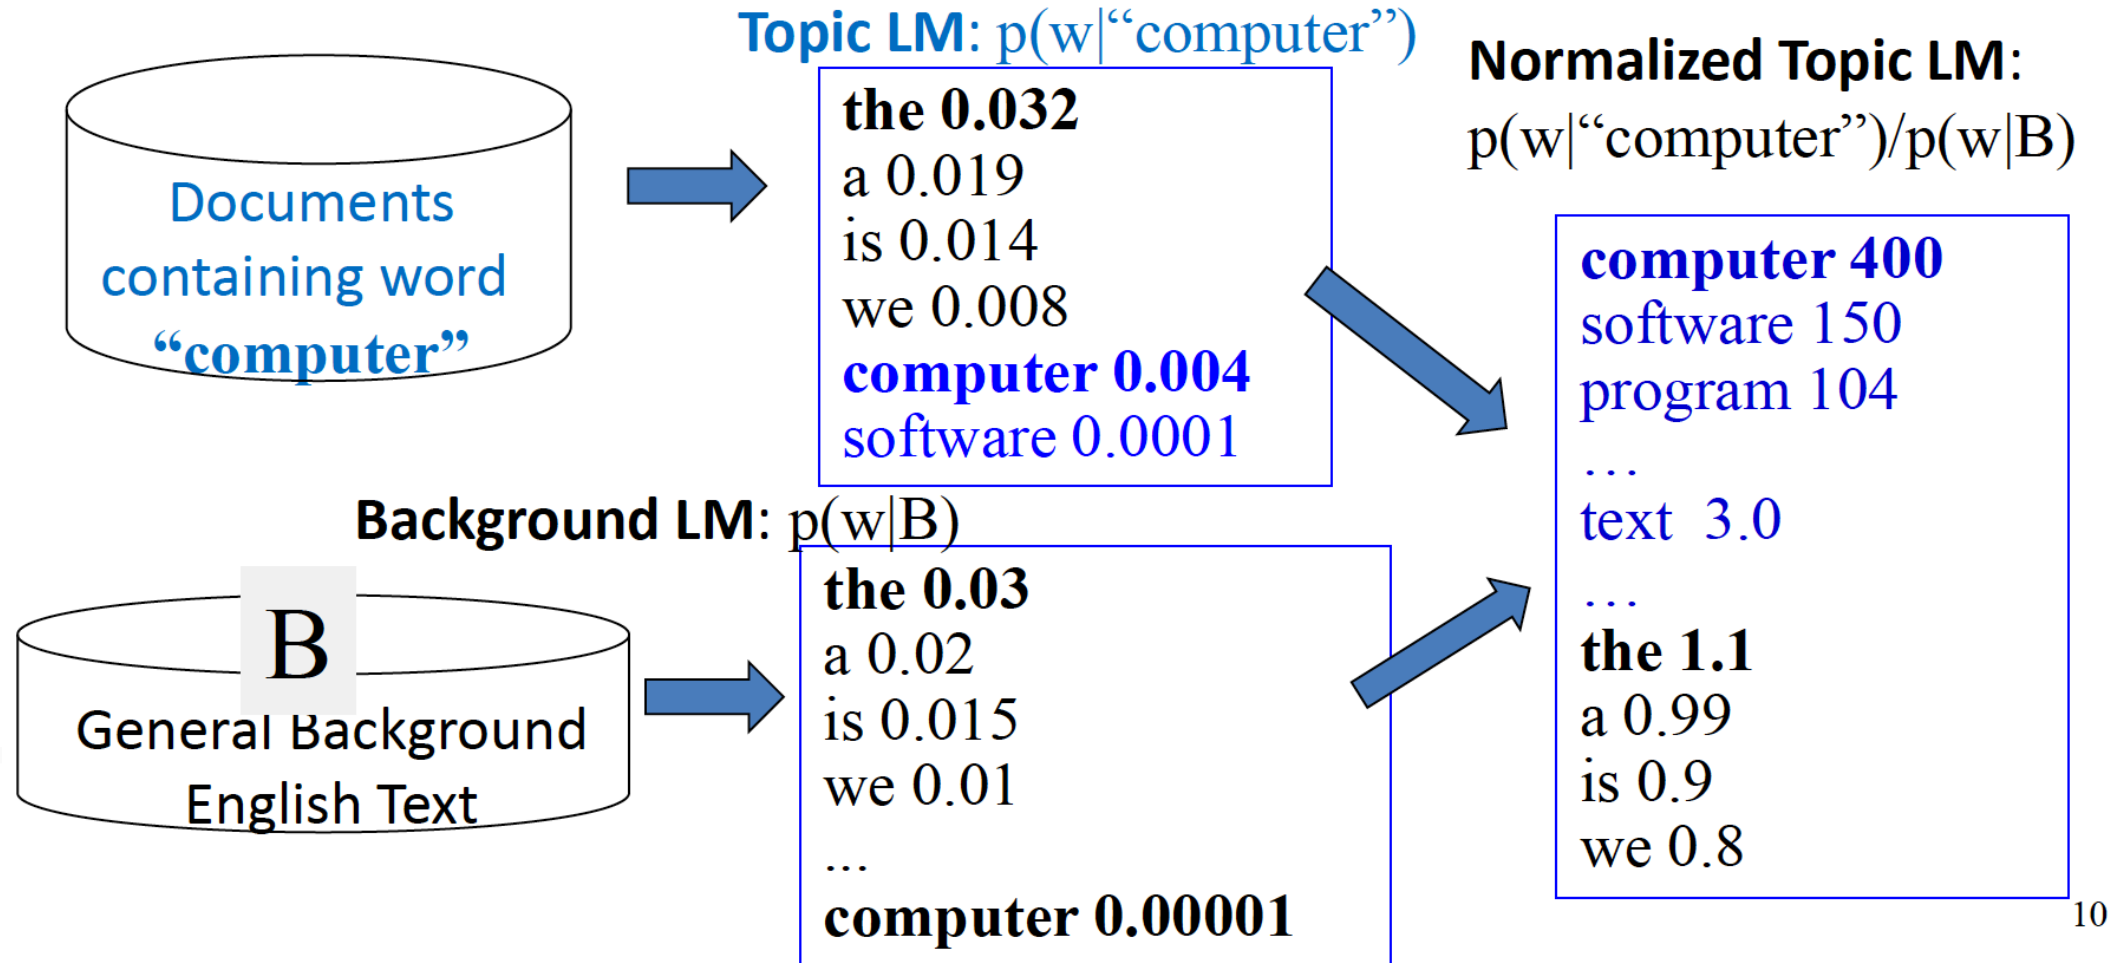

LMS for Association Analysis

What words are semantically related to “computer”?

LMs for Association Analysis

What words are semantically related to “computer”?

Summary

- Language Model = probability distribution over text
- Unigram Language Model = word distribution
- Uses of a Language Model
 - Representing topics
 - Discovering word associations
